Summary

Engineer with a CS degree and experience keeping production systems alive for a business that could not tolerate downtime. Strong at root-cause troubleshooting, SQL, and data work, and comfortable being the person non-technical users call when something needs fixed. Looking for a technical solutions, implementation, or support engineering role with real problems to identify.

Technical Skills

Data & Debugging: SQL, PostgreSQL (indexing & query optimization), ETL pipelines, log analysis, root-cause investigation

Languages: Python, SQL, TypeScript, C++

Systems & Integrations: Linux/Unix, Docker, REST APIs, Toast POS, Square, Google Cloud / Workspace APIs

Quality & Process: pytest, Vitest, GitHub Actions, monitoring and alerting, plain-language documentation

Experience

Software Engineer

February 2026 – Present

J&K Present

El Paso, TX (Remote)

- Sole engineer responsible for the production platform running daily operations at a 3-venue hospitality company; served as the escalation point for every technical problem across the business.
- Traced intermittent production failures to root cause instead of patching symptoms, adding retry logic and monitoring that raised uptime from the low 90s to roughly 99.9%.
- Built and maintain ETL pipelines that convert Toast, Square, and state financial data into clean PostgreSQL reporting tables; tuned indexing and queries to drop report generation from minutes to under a second.
- Supported non-technical users directly: trained staff on every tool I shipped, wrote plain-language documentation, and turned recurring support questions into product fixes.
- Built an inventory reconciliation system comparing predicted depletion against point-of-sale data, cutting product loss by about 60% and giving managers a weekly variance report they act on.
- Wrote unit and integration tests wired into GitHub Actions, keeping coverage on core services above 90% and catching regressions before users ever saw them.

Selected Projects

PennysWorthe – Prediction Platform [Project Write-Up] | *Next.js, FastAPI, PostgreSQL, TensorFlow*

- Designed backend services to ingest, validate, and preprocess daily market data for 24 assets, with automated training and inference pipelines and REST APIs serving predictions and historical data.

Interactive C++ Learning Platform | *Next.js, TypeScript*

- Built a 30-topic learning platform with an in-browser code runner and a randomized debugging simulator that plants verified bugs in a multi-file codebase for timed troubleshooting practice.

Market-Data Structures in C++ [GitHub] | *C++, STL*

- Open-source order-book trackers and alerting engines, each verified against edge-case assert harnesses.

Education

New Mexico State University

December 2025

Bachelor's Degree – Computer Science (GPA: 3.7 / 4.0)

Las Cruces, NM
